

Utimaco u.warn
Command Post CBE
Comprehensive central alert creation and
management system for all delivery channels

Utimaco
u.warn CBE

Command Post CBE

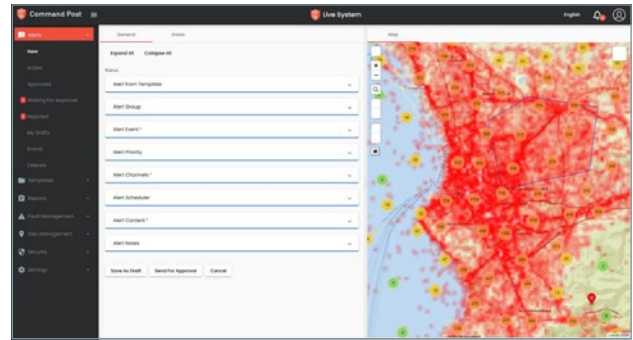

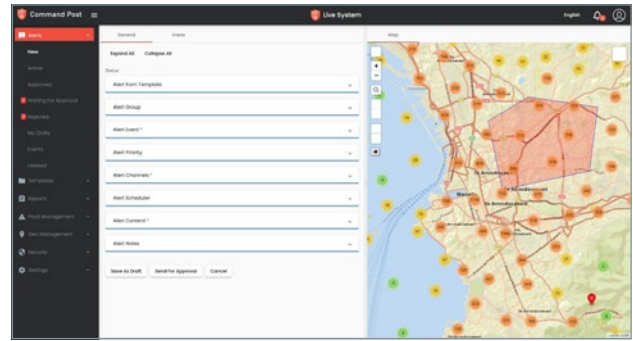

The u.warn Command Post is a central alerts creation, control and management tool for all u.warn delivery channels. It is a fully fledged CBE (Cell Broadcast Entity) that in addition to the CBC, also correlates with all other u.warn products, starting from location-based SMS all the way through the variety of u.warn apps, including desktop alerts, email and IVR.

When lives are at stake, one needs absolute confidence that your emergency alert system is infallible and will be able to handle any crisis on every level.

The Command Post is primarily used by government entities, public and educational institutions as well as enterprises. Its state-of-the-art graphical user interface includes all features required for rapid and easy operation.

Among others, the Command Post supports pre-defined alerts libraries, pre-defined areas list, various map technologies, layers, roles and permissions, allowing customization for protocols and permissions of the customer and their specific roles and responsibilities. Also, the required dashboards and reports are provided for close monitoring of the alert via the delivery channels.

Whilst alerts may be activated manually, the Command Post can also connect to external monitoring devices e.g. earthquake, tsunami or flood sensors.

Predefined alert templates and libraries

Predefined target areas

Customized operation workflow

Multiple alert languages

Easy to use customized GUI

Multiple government agencies

Hundreds of users

Users' roles and responsibilities Management

The control center for all alarm notifications

The Command Post allows for advance preparation and readiness for all fundamentals required in an emergency and so when the situation arises, alerts and protocols are easily and rapidly activated.

Command Post works as an alert aggregator by controlling and managing the logic of the public warning system solution.

The distribution channels serve as the means of communicating information to the public. They are defined channels in the system pre-configured for use in specific scenarios to alert the population about emerging disasters or critical information. Once submitted and approved, the alerts are distributed reliably to the public within seconds through:

CBC module

Connectivity with multiple CBCs with support of redundant links including CMAS broadcast messages

Interactive Broadcast messaging

Direct interactive option-based communication with the public via a broadcast message with selection menus that garner responses.

SMS module

Connectivity with SMS Alert Server for SMS distribution through mobile operator's SMSC

Mobile app module

Apps downloaded by the public to their mobile devices allow direct and immediate location based communication. The u.warn app available for Android and iOS devices is one such example

SIM Toolkit

A SIM toolkit application installed on SIM/E-SIM cards, which displays relevant location based alerts sent from Command Post.

Social Media channels

Such as Facebook, Twitter, or Instagram

Other elastic, government accessible channels

May be available for use such as TV, Radio, sirens and billboards.

About Utimaco

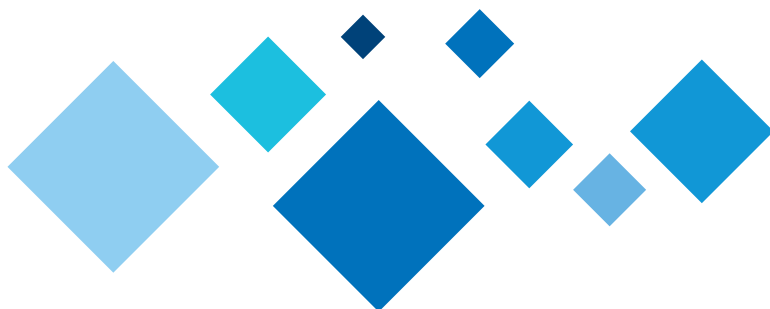

Utimaco is a global platform provider of trusted Cybersecurity and Data Protection solutions and services with headquarters in Aachen (Germany) and Campbell, CA (USA).

Utimaco develops on-premises and cloud-based hardware security modules, solutions for key management and data protection as well as Public Warning Systems. Utimaco is one of the world's leading manufacturers in its key market segments.

400+ employees around the globe create innovative solutions and services to protect data, identities, citizens and digital assets with responsibility for global customers and citizens. Customers and partners in many different industries value the reliability and long-term investment security of Utimaco's high-security products and solutions.
